This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with alterated mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's heredicary optic neuropathy (LHON), mitochondrial concephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRP) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, anticonvulsant, antiarthritic, osteopathic, ophthalmological and cytostatic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   weed controller metabolism; weed; herbicide; herbicide-resistant plant;
                                                                                                                                                                                                                                                                    Identifying a mitochondrial target for drug screening assays and for treating diseases associated with altered mitochondrial function, comprises detecting a modified polypeptide in a sample and correlating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  12 WVPASPDTGLDPLT------VRRHVPAVWVLLSRDP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                             useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           mitochondrial; human; screening assay; diabetes mellitus;

ATCC39727 (formerly Actinomadura sp. ATCC39727). The 37 proteins encoded by the gene cluster are involved in the biosynthesis of the glycopeptide A40926. dbv ORF 1, 2, and 37 encode polypeptides required for the synthesis of 4-hydroxy-phenylglycine residues of A40926. dbv ORF 30-34 and 37 encode polypeptides required for the synthesis of 3, 5-dihydroxy-phenylglycine residues of A40926. dbv ORF 16, 17, 25, 26 and 36 encode polypeptides required for the synthesis of heptapeptide skeleton of A40926. dbv ORF 10 encodes polypeptide required for the beta-hydroxylation of the trycosine residues of amino acide required for the beta-hydroxylation of the trycosine residue of amino acide of the aromatic residues of amino acide a required for the beta-hydroxylation of the trycosine residue of amino acide of the aromatic residues of amino acide at positions 2 and 4, and 6, 1 and 3, and 5 and 7 of A40926. dbv ORF 9, 23 and 29 encode polypeptides required for the attachment of mannosyl residues or amino acide polypeptides required for the attachment of mannosyl residues or N-methylation of A40926. dbv ORF 9, 18, 19, 24 and 35 encode polypeptides required for the attachment of mannosyl residues or N-methylation of A40926 dbv ORF 7, 18, 19, 24 and 35 encode polypeptides required for the attachment of mannosyl residues or N-methylation of A40926 dbv ORF 7, 18, 19, 24 and 32 encode polypeptides required for regulating the expression of one or more genes of the dbv gene cluster. The dbv gene cluster and the proteins encoded by it are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Сарв
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 4083;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    producing glycopeptide antibiotic A40926 or its precursor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ï
                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel DNA encoding a weed controller metabolism protein. A protein of the invention has herbicide activity. The proteins and their encoded genes are useful e.g. in constructing new breeds of herbicide-resistant plants and also in developing various agrochemicals. The present sequence is used in the exemplification of the

reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in dagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful in generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders (IV) appetide and polymoleotide sequences have applications in captypeptide and polymuleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the wind the capters are sequences.

GENERAL INFORMATION:

APPLICANT: Dumas Milne Edwards, Jean Baptiste

APPLICANT: Dumas Milne Edwards, Jean Baptiste

APPLICANT: Bougueleret, Lydie

APPLICANT: Bougueleret, Lydie

TITLE OF INVENTION: FULL-LENGTH HUMAN CDNAS ENCODING POTENTIALLY SECRETED PROTEINS

FILE REFERENCE: 78.US3.REG

CURRENT APPLICATION NUMBER: US/09/731,872

CURRENT PILING DATE: 2000-12-07

PRIOR APPLICATION NUMBER: US 60/169,629

PRIOR APPLICATION NUMBER: US 60/187,470

PRIOR APPLICATION NUMBER: US 60/187,470

PRIOR PILING DATE: 2000-03-06

NUMBER OF SEQ ID NOS: 482

SOFTWARE PATENT.

SEQ ID NO 459

LENGTH: 163

The invention relates to the isolation of genes AAC96900-C96947 encoding the human secreted proteins AAB52104-B52150. This sequence represents a fragment of the protein encoded by the gene given in the descriptor line. The sequence is used as a query sequence for doing BLASTX searches to determine homologous sequence to the protein. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins,

The invention relates to novel human genes (ABZ66891-ABZ68209) and the encoded secreted proteins (ABP99470-ABP99872) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of:

fragments specific for the secreted proteins, and modulators of protein activity are useful for diagnosing or treating cancers or other hyperproliferative disorders. Additionally, the secreted proteins and their nucleic acids may also be used in the treatment of autoimmune disorders, inflammatory disorders, diseases involving angiogenesis, AIDS (acquired immunodeficiency syndrome), hepatitis, anaemia, and to promote wound healing. Nucleic acids of the invention may be used for chromosome identification, chromosome mapping, in gene therapy, for identifying individuals from minute biological samples, as hybridisation probes, and secreted protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises the amino acid and coding sequence of human secreted proteins. The DNA and protein sequences of the invention are useful in the treatment of cardiovascular disorders, such as: arrhythmia, artherosclerosis, stroke, endocarditis, congestive heart failure, rheumatic heart disease, cardiomyopathy, haemorrhoids, varicose veins, migraine, or thrombosis. The DNA and protein sequences may also be used for treating or preventing: neural disorders, immune system disorders, muscular disorders, reproductive disorders, gastrointestinal disorders,

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide expression, comprising any of the 27,400 fully defined nucleotide acquences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule expression (comprising a plurality of probes for measuring human cells or tissues. Also included are a spatially-capters of single exon nucleic acid probes cited above, where each of the plurality of probes is separately and addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a method of exon microarray for measuring human gene expression, a vector comprising at least 8 contiguous amino acids of any of the above- mentioned amino acid so fer any of the above- mentioned amino acid so fer any of the above- mentioned amino acid so fer any of the above- mentioned amino acid so fer any of the above- mentioned amino acid so fer any of the above- mentioned amino acid so fer any of the above- mentioned amino acid so sequences (optionally with conservative amino acid substitutions), and isolated antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or microarrays to a customer desiring to measure gene expression, a method of providing
                                                                                                                                                                                         ö
pulmonary disorders, renal disorders, proliferative disorders and/or
cancerous diseases. The present amino acid sequence represents a human
secreted protein of the invention. NOTE: The present sequence is shown on
the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     19-JUL-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .-NUD-8.
              human gene expression data by subscription, and a computer-readable storage medium which contains a database having a plurality of records (each record including data on the expression of a single exon probe cited above. The probe, methods and apparatus are useful in gene expression analysis. The probes and apparatus are useful in gene expression analysis. The probes may be used as tools for surveying tissues to detect the presence of expressed messages that contain their specific exon, or in constructing genome-derived single exon microarrays. In addition, the probes are used in identifying and characterising alternative splicing events, in detecting and characterising gross alternative splicing events, in detecting and characterising gross alternative splicing exones, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human this patent did not form part of the invention. Note: The sequence data for this patent did not form at directly from USPTO at sequence in the sequence obtained in electronic format directly from USPTO at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Protein identification, signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

```
Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; prostate cancer antigen; cytostatic; uropathic; diagnostic; reproductive system; chromosomal marker; forensic; urinary disorder;

MEC (major histocompatibility complex) class II molecules on antigen-
presenting cells and are capable of activating epitope-specific CD4+
helper T cells. The invention also relates to a cell-mediated immunity
activation composition comprising an ErbB2 epitope peptide of the
invention, nucleic acids encoding a peptide of the invention, vectors and
ransformants comprising such nucleic acids, a method of determining the
number of CD4+ T cells reactive with ErbB2, and a method of preparing an
ErbB2 epitope peptide. The peptides of the invention are useful as immune
system activators and in the field of drug research. The present sequence
represents an ErbB2 peptide corresponding to residues 11-55 of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a fragment of the human ErbB2 extracellular domain corresponding to amino acids 22-53 which is capable of binding the monoclonal antibodies 7C2 and 7F3. This region is used in a method to identify antibodies which bind to ErbB2 and induce apoptosis of a cell which overexpresses ErbB2. The antibodies can also be used to detect ErbB2 on a cell. The antibodies can be used for treating disorders such as beingn or malignant tumours, (e.g. renal, liver, kidney, bladder, breast, gastric, ovarian, colorectal, prostate, pancreatic, lung, vulval, thyroid, hepatic carcinomas, sarcomas, glioblastomas, and various head and neck tumours), leukemia's and lymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypothalamic and other glandular, macrophagal, epithelial, stromal and blastocoelic disorders, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New anti-ErbB2 antibodies - which induce apoptosis in cells which overexpress ErbB2, used to treat e.g. tumours or inflammatory, anglogenic or immunologic disorders.
peptides of the invention, which are 15-25 amino acids in length, bind MHC (major histocomparibly two community)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ExbE2; epitope; monoclonal antibody; identification; apoptosis;

                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel isolated human prostate cancer antigen
polynucleotides (I) and polypeptides (II). (I) and (II) are useful for
preventing, treating or ameliorating a medical condition when
administered. (I). (II) and the antibody to (II) are useful for treating,
comministered. (I). (II) and the antibody to (II) are useful for treating,
comministered. (I). (II) and the antibody to (II) are useful for treating,
complities, and blood-related disorders related to the reproductive
complities; and blood-related disorders e.g. thrombosis. (II) can be used
for testing and detection e.g. as a chromosomal marker and in forensics.
(I) and the anti-(II) antibody can be used in testing and detection in
immunossays. AAU22702-AAU22913 represent the human prostate cancer
antigen amino acid sequence data for this patent did not form part of
invention. Note: The sequence data for this patent did not form part of
the printed specification, but was obtained in electronic format directly
committee of the printed process the printed process the printed specification, but was obtained in electronic format directly

The invention relates to treating cancer in a human susceptible to or diagnosed with a disorder characterized by overexpression of ErbB2 creeptor. The method comprises administering an initial dose of at least approx.5 mg/Ks of the anti-ErbB2 antibody, and administering subsequent doses of the antibody in approximately the same amount or less than the initial dose. The method is useful for treating a disorder characterized initial dose. The method is useful for treating a disorder characterized by overexpression of ErbB2 receptor, particularly a benign or malignant tumour, or a cancer. The cancer is selected from breast cancer (particularly metastatic breast carcinoma), leukemia, squamous cell cancer, small-cell lung cancer, non-small cell lung cancer, pancreatic cancer, gastrointestinal cancer, non-small cell lung cancer, ovarian cancer, liver cancer, bladder cancer, hepstoma, colon cancer, ovarian cancer, inver cancer, bladder cancer, hepstoma, colon cancer, ovarian cancer, invercancer, vulval cancer, thyroid cancer, hepstic cancer, cancer, pastivary gland carcinoma, kidney cancer, cancer, prostete cancer, vulval cancer, thyroid cancer, hepstic cancer, cancer, pastivary gland carcinoma and various types of head encek cancer. The present sequence represents the 7C2/7F3 peptide epitope of ErbB2, recognised by MADS 7C2 and 7F3 as determined by deletion mapping
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Treating a human patient with a disorder characterized by overexpression of ErbB2 receptor such as a tumor or cancer (e.g. metastatic breast carcinoma) comprises administering several dosages of an anti-ErbB2
                                                                                                                                                                                                                                          receptor; anti-ErbB2 antibody; tumour; cancer; breast cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          19.3%; Score 42.5; DB 4; Length 32; 55.6%; Pred. ErbB2 protein is used for raising antibodies for treating a human with a disorder characterised by overexpression of the ExbB2 receptor, using a combination of an anti-ErbB2 antibody and a chemotherapoutic agent other than an anthracycline derivative. Disorders characterised by overexpression of the ErbB2 receptor include benign or malignant tumours. The cancer may be breast, squamous cell, (non)-small liver, bladder, hepatoma, collon, colorectal, endometrial carcinoma, salivary gland carcinoma, kindey, prostate, vulval or thyroid cancer, hepatic carcinoma and various forms of head-and-neck cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New combination of an anti-ErbB2 antibody and a chemotherapeutic agent

The invention relates to an isolated or purified nucleic acid from a virus associated with multiple sclerosis and/or rheumatoid arthritis, comultiple sclerosis associated virus (MSRV)-1. The nucleic acids comprise pol, gas or reverse transcriptase genes (or their fragments) encoding the proteins or defined peptides (including immunodominant peptides.

CC antignato peptides or conserved motifs). Also included are a process for antignant peptides or conserved motifs). Also included are a process for detecting a virus associated with multiple sclerosis or rheumatoid arthritis, a virus associated with multiple sclerosis or rheumatoid arthritis, a princer for the amplification by polymerisation of a nucleic acid of a viral material associated with multiple sclerosis or rheumatoid arthritis, a polypeptide exhibiting an inhibitory activity from MSRV, and an antibody directed against the MSRV-1 virus obtained by immunologically reacting a human or animal body or cells with an immunogenic agent consisting of the antigenic polypeptide defined above. The nucleic acids are useful for detecting a biological sample a virus associated with multiple sclerosis or rheumatoid arthritis, or for detecting in a biological sample, the presence of or exposure to a virus associated with multiple sclerosis or rheumatoid arthritis. The present of the patent do not match the SEQ ID numbers in the sequence. Note: The SEQ ID numbers for the sequences as displayed in the main body of the patent do not match the SEQ ID numbers in the sequence listing.

C sequences the authors intended to claim.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated or purified nucleic acid associated with multiple sclerosis and/or rheumatoid arthritis, useful for detecting a virus associated with multiple sclerosis or rheumatoid arthritis in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Perron H, Besseme F, Bedin F, Paranhos-Baccala G;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel method of treating a human patient susceptible to or diagnosed with a tumour expressing the ErbB2 (HER2, cserb-B2) tumour antigen. The method comprises treating the patient with an expension of the musically, and then treating the patient with the anti-ErbB2 antibody or a chemocherapeutic agent. In the patient with the anti-ErbB2 antibody or a chemocherapeutic agent. In the patient with the anti-ErbB2 antibody 4D5, which binds to the an epitope on the extracellular domain of ErbB2 (residues 561-625; AAB48766). The method of the invention is used to treat a human patient susceptible to, or diagnosed with breast tumour, squamous cell tumour, small cell lung tumour, non-small cell lung tumour, gastrointestinal tumour, small cell lung tumour, colorctal tumour, glioblastoma, hepatoma, cervical tumour, ovarian tumour, or a tumour of the lung and or neck. The present sequence represents the epitope of the human ErbB2 (residues 22-58) which binds to the monoclonal antibodies of the account of the monoclonal antibodies of the account of the invention and in the coll of the monoclonal antibodies of the account of the monoclonal antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating a patient susceptible to, or diagnosed with, a tumor associated with breast, squamous cell, colon, kidney, liver by administering anti-ErbB2 antibody before and after surgical removal of the tumor.

New compositions containing immunogenic peptide epitopes for various HLA class II DR molecules useful for inducing helper T cell response.

Claim 1; Page 42; 60pp; English.

The present invention relates to a new pharmaceutical composition comprising a unit dose form of a peptide, or analogue, comprising an epitope selected from those represented by peptides AAY98812-Y99339 which are derived from various antigens for various human leucocyte antigen class DR molecules, representative of the world winde population. The peptide hanalogue binds to an HLA class II molecule at an IC-50 of less than or equal to 1,000 nM. The pharmaceutical focuses the immune response the laper T cell response. The pharmaceutical focuses the immune response to the diseases and cancer. Examples of diseases that can be created using the peptide containing pharmaceutical include autoimmune treated using the peptide containing pharmaceutical include autoimmune created using the peptide containing pharmaceutical include autoimmune diseases (rheumatoid arthritis, multiple sclerosis, and myasthenia created using the peptide epitopes can be used to enhance immune response against other immunogens administered with the peptides. Or streptococcal endocarditis or glomenlonephritis and food hypersensitivities. The peptide epitopes can be used to enhance immune response against other immunogens administered with the peptides or Diseases which can be treated using immunogenic mixtures include prostate carcinoma, lymphoma, and condyloma acuminatum. The peptides may also be useful as diagnostic or therapeutic agents. The peptides may also be useful as diagnostic creargnorms, for example, to determine the susceptibility of an individuals will be at substantial fisk of developing chronic infection. Creargnorms will be at substantial fisk of developing chronic infection. The selection of appropriate T and B cell epitopes should allow the epitopes of pathogens which are characterized by high sequence epited by a period of pathogens which are characterized by high sequence.

Sequence 56614, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:
APPLICANT: Homburger et al.
TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster FILE REFERENCE: File Reference: 7326-094
CURRENT FILING DATE: 1999-03-17
NUMBER OF SEQ ID NOS: 62517

SOFTWARE: PatentIn Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 41398, Application US/09270767
